# Java 环境搭建及 IDEA 教程

## 一. Java 环境搭建

### 1.准备工作

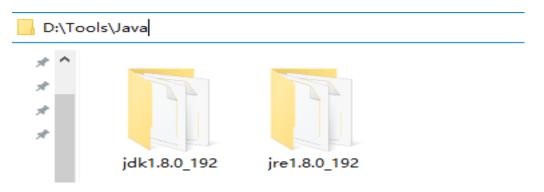

Jdk , Tomcat , Maven , Idea 以及破解包

### 2.Jdk 安装

(1)安装

例如: D:\tools\Java\jdk1.8.0\_1017, D:\tools\Java\jre1.8.0\_101

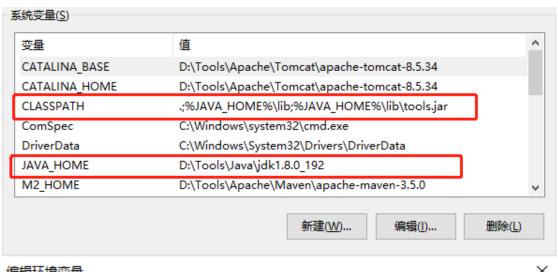

(2)配置环境变量 (配置 ClassPath 的属性是因为可以再任意盘编译 )

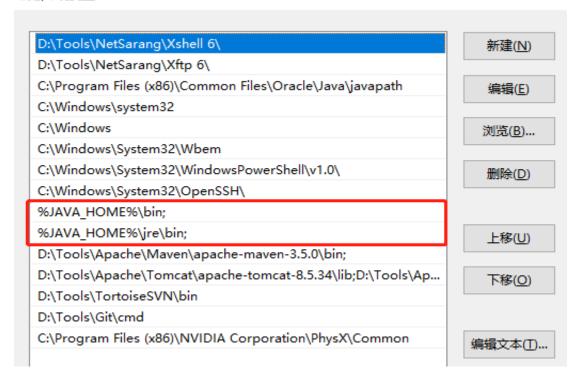

JAVA HOME: D:\tools\Java\jdk1.8.0 101

Path: %JAVA\_HOME%\bin;%JAVA\_HOME%\jre\bin;

CLASSPATH: .;%JAVA HOME%\lib;%JAVA HOME%\lib\tools.jar

编辑环境变量

3.完成后 cmd 进行校验: java -version

## 2.Tomcat 安装

#### (1)配置环境变量例如:

CATALINA HOME: D:\tools\apache-tomcat-8.0.45

CATALINA BASE: D:\tools\apache-tomcat-8.0.45

Path: %CATALINA HOME%\lib;%CATALINA HOME%\bin

(2)完成后 cmd 进行校验, startup

#### 3.Maven 安装

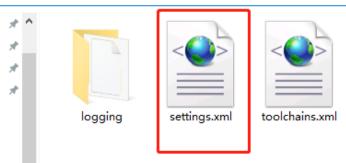

(1)配置环境变量例如:

M2 HOME: D:\Tools\Apache\Maven\apache-maven-3.5.0

Path: %M2 HOME%\bin;

- (2) 完成后 cmd 进行校验, mvn-v
- (3) 找到 maven 存放地址,修改 conf 文件夹里面的 settings.xml 文件,设置仓库地址

#### (4)添加 maven 镜像配置

<mirror>

<id>nexus-aliyun</id>

<mirrorOf>\*</mirrorOf>

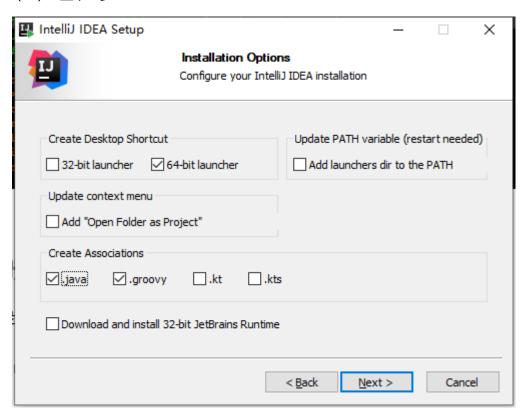

<name>Nexus aliyun</name>

<url>http://maven.aliyun.com/nexus/content/groups/public</url>

</mirror>

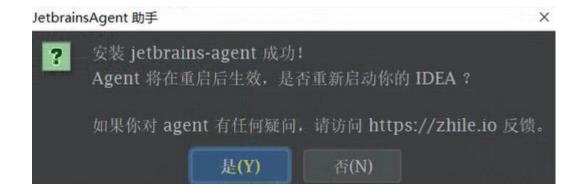

#### 4.Idea 的安装与破解

#### (1)一直下一步

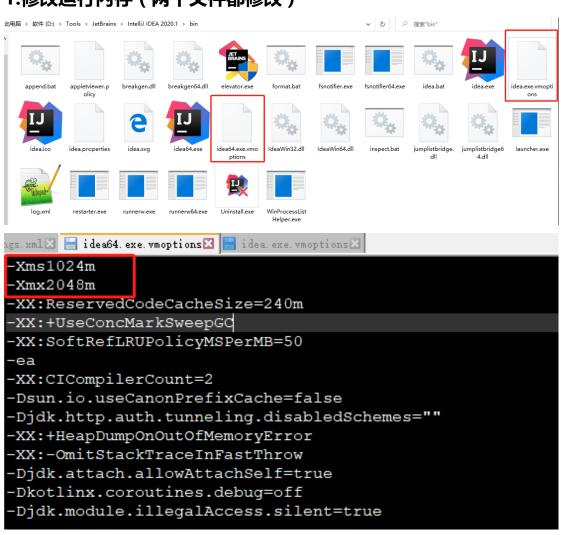

(2)将 jetbrains-agent 拖入 Idea 界面

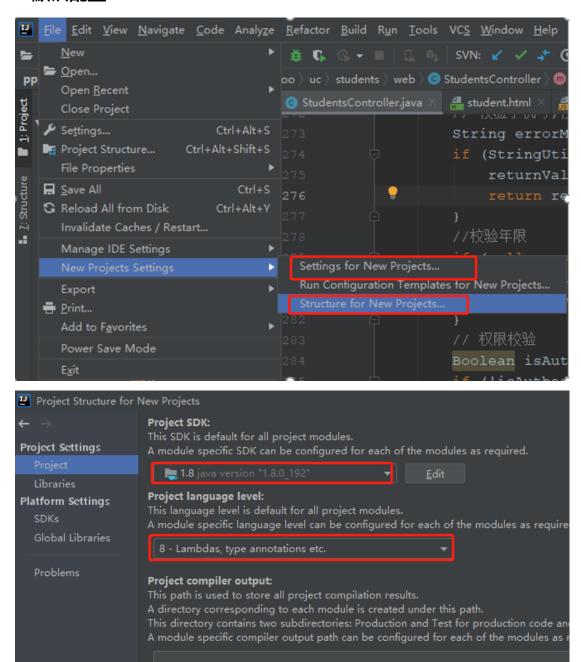

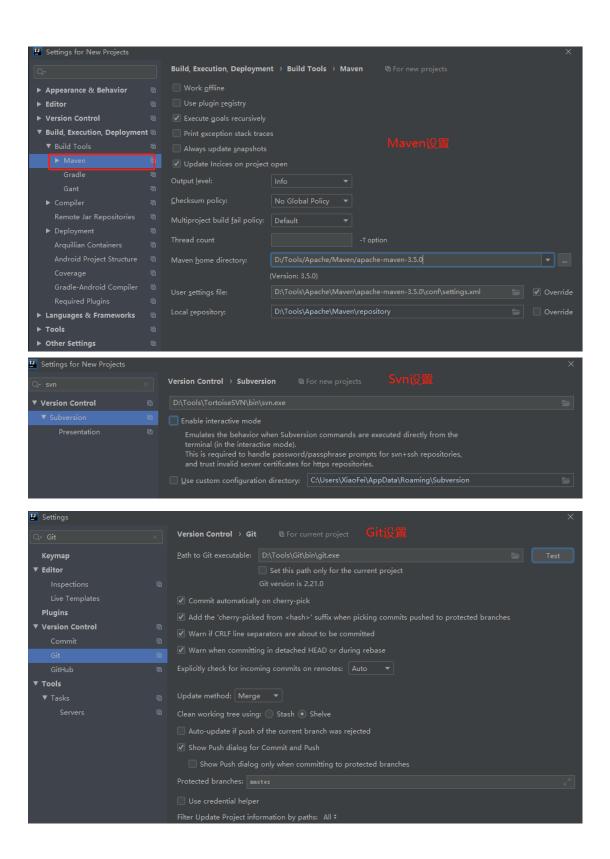

## 二.IDEA 使用教程

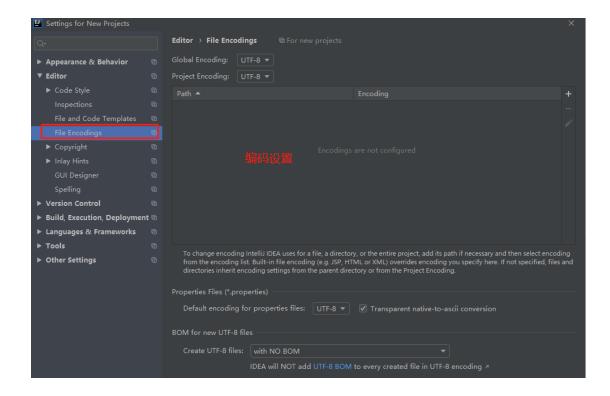

#### 1.修改运行内存(两个文件都修改)

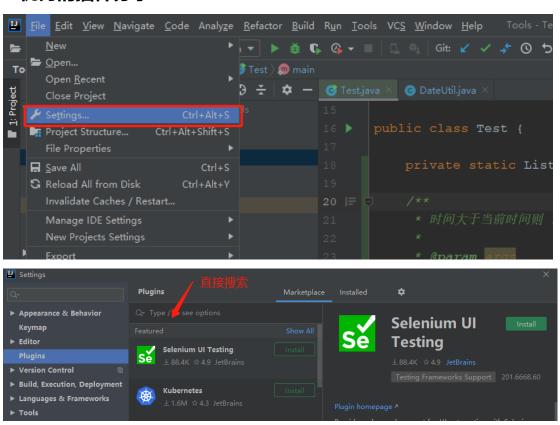

### 2.默认配置

#### 3.优秀的插件分享

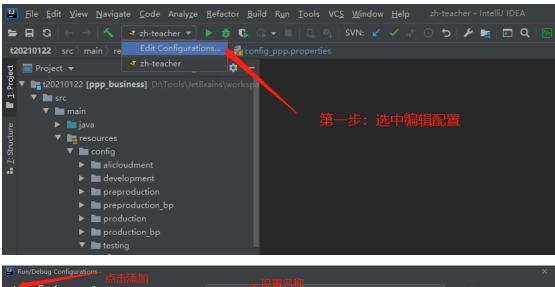

(1) JsonFormat (Json转 Bean)

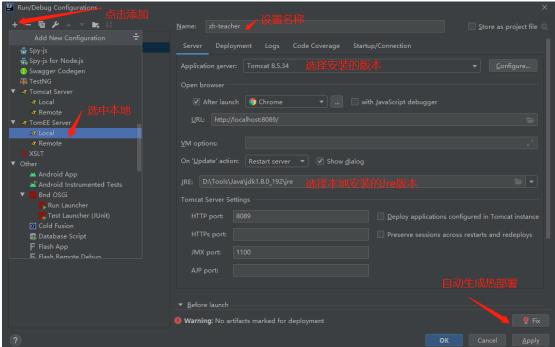

- (2) Lombok (简单 POJO)
- (3) Alibaba Java Coding Guidelines (Java 开发规范)
- (4) Free MyBatis plugin (Dao与xml 相互跳转)
- (5) Translation (强大的翻译)
- (6) Maven Helper (Maven 工具)
- (7) GitLab Projects (Git 工具)
- (8) GenerateAllSetter (生成对象 Set Get)
- (9) String Manipulation (大小写转换)
- (10) MOMO Code Sec Inspector (代码安全漏洞检测)

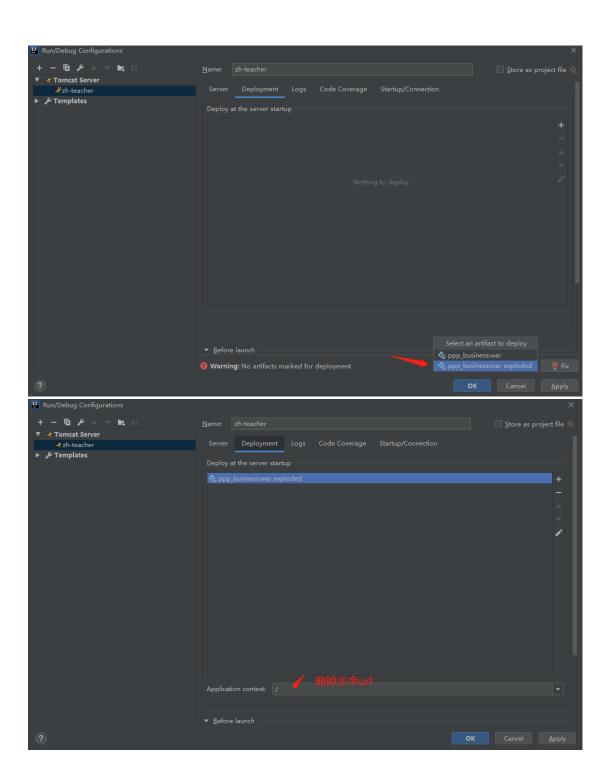

### 4.项目启动运行和打包

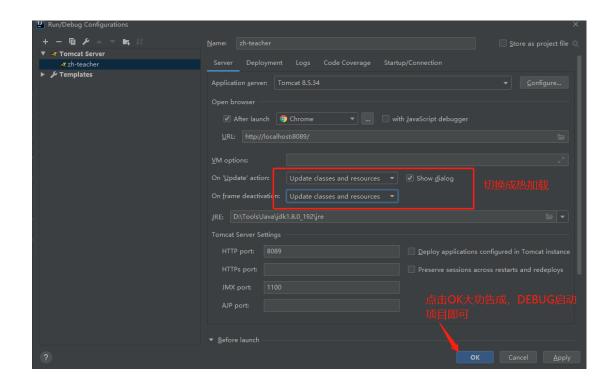

(1) SpringBoot 或者 SpringCloud 项目

(2) JavaWeb 项目启动配置 Tomcat

## 5.快捷键分享

(1)浏览文件:

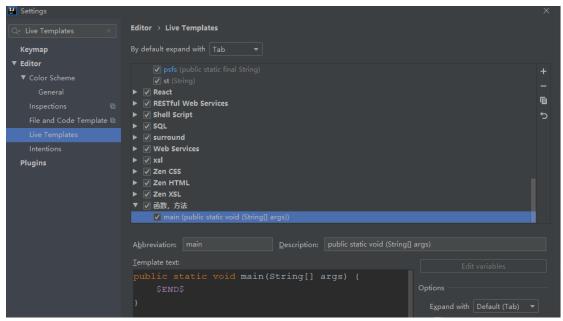

Next Edit Location

#### (4) 查看位置-上一次操作:

## 6.代码小助手 Live- Templates (缩写生成代码)

(1)函数,方法: main 函数

```
public static void main (String[] args){
$END$
}
(2) psfi, psfs
public static final String $var1$ = "$var2$";
public static final int $var1$ = $var2$;
$END$
public static final String $var1$ = "$var2$";
$END$
(3) ps,psc(c, 带有注释)
private String $VAR$;
$END$
private String $var1$;
$END$
  * $VAR1$
private String $VAR2$;
$END$
* $var1$
*/
private String $var2$;
```

#### 7. 选中代码 Alt+Enter 与 Ctrl+ALT+T 操作

#### Show Intention Actions Alt+Enter

- (1)自动创建函数:主方法创建函数
- (2) foreach 替换 for 循环
- (3)字符串 format 或者 build
- (4)实现接口
- (5)单词拼写,如果单词拼写有问题下面会有绿色波浪线
- (6)导包

### 8. 编写高质量代码快捷键

- (1)重构
  - <1>重构变量 Shift+F6
  - <2>重构方法 Ctrl+F6,或者 Alt+Enter
- (2)抽取
  - <1>抽取变量:Ctrl+Alt+V
  - <2>抽取静态变量: Ctrl+Alt+C
  - <3>抽取成员变量: Ctrl+Alt+F
  - <4>抽取方法参数: Ctrl+Alt+P
  - <5>抽取函数:Ctrl+Alt+M
  - (3)批量修改
  - <1>Ctrl+Shift+Alt+J

## 9. 调试程序(断点调试)

(1)添加断点: Toggle Line Breakpoint Ctrl+F8

(2) 单步运行: 进入 Debug 模式, 单步操作"F8"

(3) Resume 操作: Resume Program F9

如果有下一个断点直接跳过去,如果没有程序直接结束

(4) 查看所有断点: Stiew Breakpoints... Ctrl+Shift+F8

(5)禁止所有断点:

(6)条件断点:在断点上,右键,可以添加"判断条件"之类的

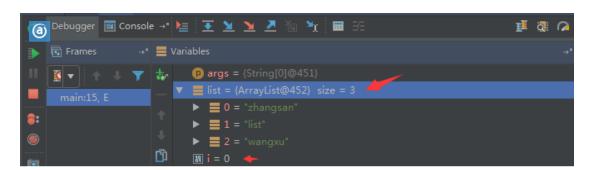

箭头1:下一步

箭头2:进方法

箭头3:出方法

箭头 4:运行到制定行代码

(9) setValue: 选中F2

后续持续更新中。。。。。
